## 1. Application

This technical literature applies to color TFT-LCD module, LQ10D368.

These technical literature sheets are the proprietary product of SHARP CORPORATION("SHARP") and include materials protected under copyright of SHARP. Do not reproduce or cause any third party to reproduce them in any form or by any means, electronic or mechanical, for any purpose, in whole or in part, without the express written permission of SHARP .

The device listed in these technical literature sheets was designed and manufactured for use in general electronic equipment.

In case of using the device for applications such as control and safety equipment for transportation(aircraft, trains, automobiles, etc. ), rescue and security equipment and various safety related equipment which require higher reliability and safety, take into consideration that appropriate measures such as fail-safe functions and redundant system design should be taken .

Do not use the device for equipment that requires an extreme level of reliability, such as aerospace applications, telecommunication equipment(trunk lines), nuclear power control equipment and medical or other equipment for life support .

SHARP assumes no responsibility for any damage resulting from the use of the device which does not comply with the instructions and the precautions specified in these technical literature sheets .

Contact and consult with a SHARP sales representative for any questions about this device .

## 2. Overview

This module is a color active matrix LCD module incorporating amorphous silicon TFT (Thin Film Transistor). It is composed of a color TFT-LCD panel, driver ICs, control circuit and power supply circuit and a backlight unit. Graphics and texts can be displayed on a  $640 \times 3 \times 480$  dots panel with 262,144 colors by supplying 18 bit data signal (6bit/color), four timing signals, +5V DC supply voltage for TFT-LCD panel driving and supply voltage for backlight.

The TFT-LCD panel used for this module is a low-reflection and higher-color-saturation type. Therefore, this module is also suitable for the multimedia use.

Optimum viewing direction is 6 o'clock.

Backlight-driving DC/AC inverter is not built in this module.

## 6-2. Backlight driving

The backlight system is an edge-lighting type with single CCFT (Cold Cathode Fluorescent Tube). The characteristics of single lamp are shown in the following table.

Ta=25°C

Parameter	Symbol	Min.	Typ.	Max.	Unit	Remark
Lamp current	I <sub>L</sub>	2.0	6.0	6.5	mArms	【Note1】
Lamp power consumption	P <sub>L</sub>	—	3.0	—	W	【Note2】
Lamp frequency	F <sub>L</sub>	20	35	60	KHz	【Note3】
Kick-off voltage	V <sub>s</sub>	—	—	950	Vrms	Ta=25°C
		—	—	1400	Vrms	Ta=0°C 【Note4】
Lamp life time	L <sub>L</sub>	—	50000	—	hour	【Note5】

【Note1】 Lamp current is measured with current meter for high frequency as shown below.

\* 3pin is V<sub>LOW</sub>

【Note2】 At the condition of Y<sub>L</sub>=200cd/m<sup>2</sup>

【Note3】 Lamp frequency may produce interference with horizontal synchronous frequency, and this may cause beat on the display. Therefore lamp frequency shall be detached as much as possible from the horizontal synchronous frequency and from the harmonics of horizontal synchronous to avoid interference.

【Note4】 The open output voltage of the inverter shall be maintained for more than 1sec; otherwise the lamp may not be turned on.

【Note5】 Since lamp is consumables, the life time written above is referential value and it is not guaranteed in this specification sheet by SHARP.

Lamp life time is defined that it applied either ① or ② under this condition  
(Continuous turning on at Ta=25°C, IL=6mArms)

- ① Brightness becomes 50% of the original value under standard condition.
- ② Kick-off voltage at Ta=0°C exceeds maximum value, 1400 Vrms.

In case of operating under lower temp environment, the lamp exhaustion is accelerated and the brightness becomes lower.

(Continuous operating under for around 1 month under lower temp condition may reduce the brightness to half of the original brightness.)

In case of such usage under lower temp environment, periodical lamp exchange is recommended.

【Note6】 The performance of the backlight, for example life time or brightness, is much influenced by the characteristics of the DC-AC inverter for the lamp. When you design or order the inverter, please make sure that a poor lighting caused by the mismatch of the backlight and the inverter (miss-lighting, flicker, etc.) never occur. When you confirm it, the module should be operated in the same condition as it is installed in your instrument.

## 7. Timing Characteristics of input signals

Timing diagrams of input signal are shown in Fig.2 - ①~③

Hsync-Vsync phase difference		TVh	"	0	—	TH-THp	clock	

Note) In case of lower frequency, the deterioration of display quality, flicker etc., may be occurred.

### 7-2. Horizontal display position

The horizontal display position is determined by ENAB signal and the input data corresponding to the rising edge of ENAB signal is displayed at the left end of the active area.

Parameter		symbol	Min.	Typ.	Max.	Unit	Remark
Enable signal	Setup time	Tes	5	—	Tc-10	ns	
	Pulse width	Tep	2	640	640	clock	
Hsync-Enable signal phase difference	THE	44	—	TH-664	clock		

Note) When ENAB is fixed "Low", the display starts from the data of C104(clock) as shown

in Fig.2-①~③. Be careful that the module does not work when ENAB is fixed "High".

When the phase difference is below 104 clock, keep the "High level of ENAB is signal longer than 104-The. If it will not be kepted, the display starts from the data of C104(clock).

### 7-3. Vertical display position

The vertical display position is automatically centered in the active area at each mode

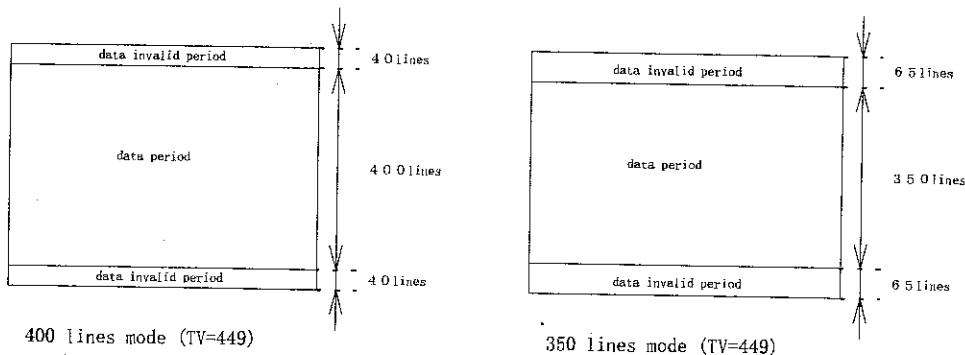

of VGA ,480-,400-,and 350-line mode . Each mode is selected depending on the polarity of the synchronous signals described in 4-1(Note1).

In each mode ,the data of TVn is displayed at the top line of the active area. And the display position will be centered on the screen like the following figure when the period of vertical synchronous signal,TV, is typical value.

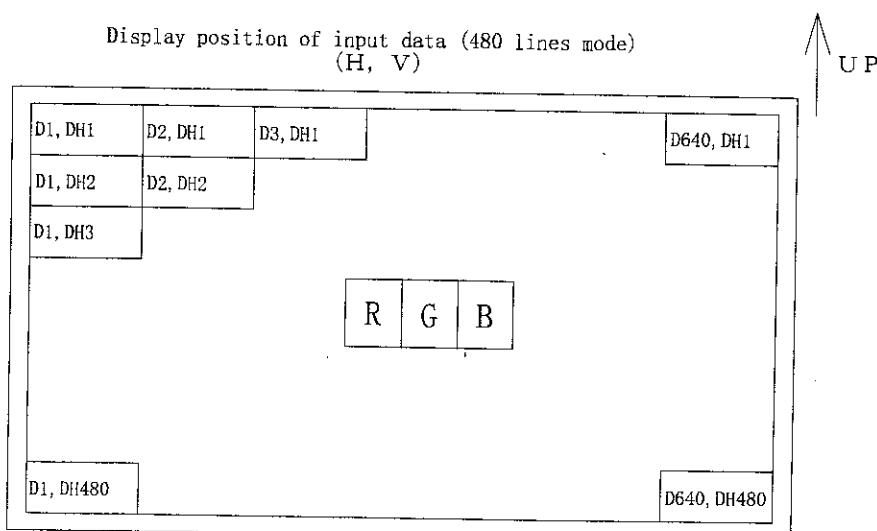

In 400-,and 350-line mode, the data in the vertical data invalid period is also displayed, So ,inputting all data "0" is recommended during vertical data invalid period.

ENAB signal has no relation to the vertical display position.

Mode	V-data start(TVs)	V-data period(TVd)	V-display start(TVn)	V-display period	Unit	Remark

\*The measurement shall be executed 30 minutes after lighting at rating. (typical condition:  $I_L=6.0\text{mA rms}$ )

The optical characteristics shall be measured in a dark room or equivalent state with the method shown in Fig.3 below.

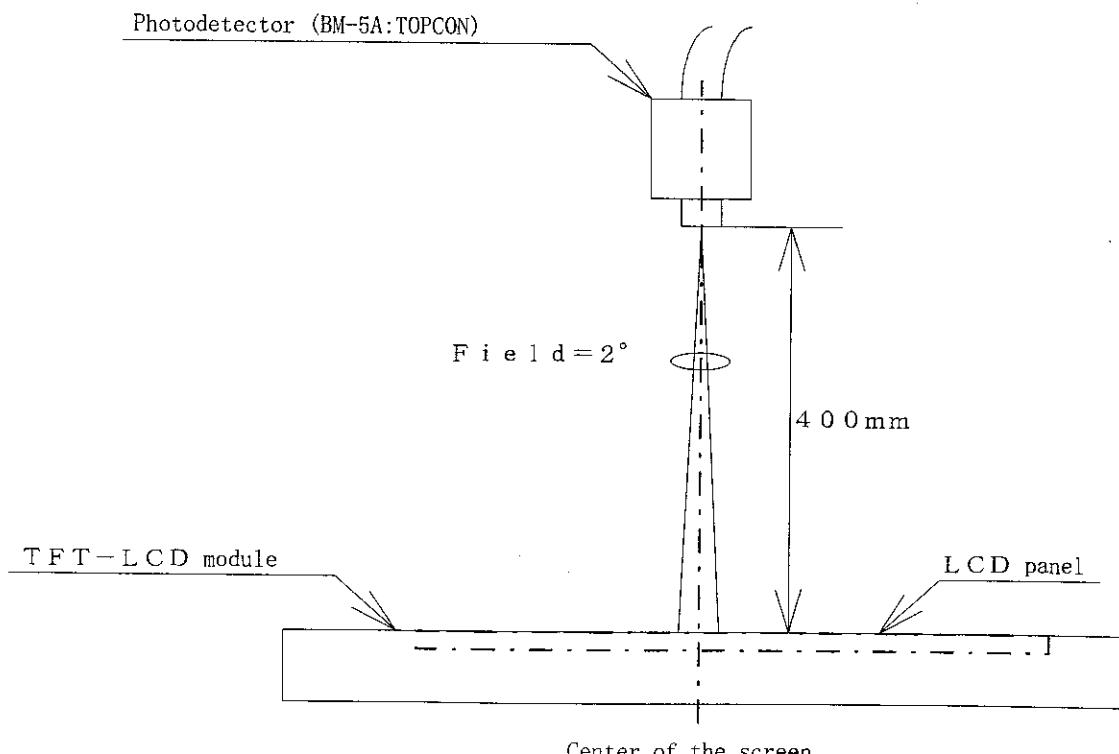

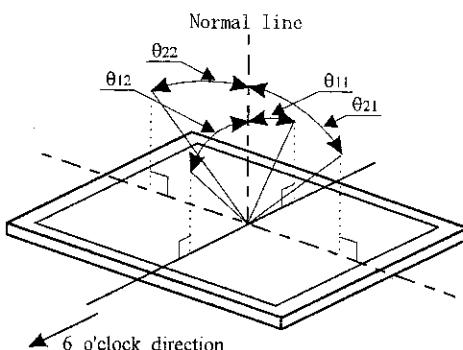

Fig. 3 Optical characteristics measurement method

【Note1】 Definitions of viewing angle range:

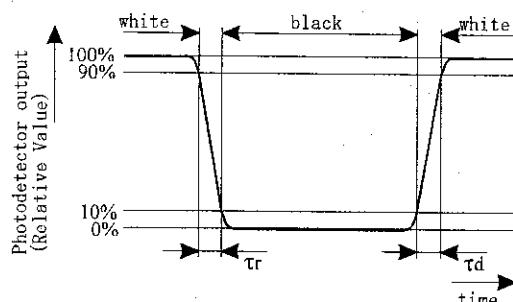

【Note2】 Definition of contrast ratio:

The contrast ratio is defined as the following.

$$\text{Contrast Ratio (CR)} = \frac{\text{Luminance (brightness) with all pixels white}}{\text{Luminance (brightness) with all pixels black}}$$

【Note3】 Definition of response time:

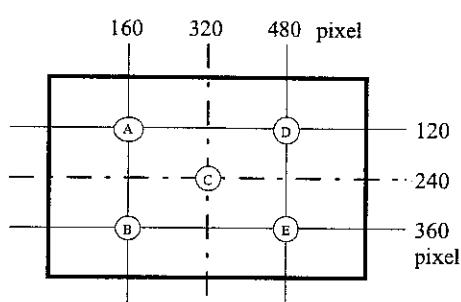

The response time is defined as the following figure and shall be measured by switching the input signal for "black" and "white".

【Note4】 This shall be measured at center of the screen.

【Note5】 Definition of white uniformity:

White uniformity is defined as the following with five measurements (A~E).

$$\delta_w = \frac{\text{Maximum Luminance of five points (brightness)}}{\text{Minimum Luminance of five points (brightness)}}$$

## 10. Display Quantity

The display quality of the color TFT-LCD module shall be in compliance with the Incoming Inspection Standard.

## 11. Handling Precautions

- a) Be sure to turn off the power supply when inserting or disconnecting the cable.
- b) Be sure to design the cabinet so that the module can be installed without any extra stress such as warp or twist.
- c) Since the front polarizer is easily damaged, pay attention not to scratch it.
- d) Wipe off water drop immediately. Long contact with water may cause discoloration or spots.
- e) When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.
- f) Since the panel is made of glass, it may break or crack if dropped or bumped on hard surface.  
Handle with care.
- g) Since CMOS LSI is used in this module, take care of static electricity and injure the human earth when handling.
- h) Observe all other precautionary requirements in handling components.
- i) This module has its circuitry PCBs on the rear side and should be carefully handled in order not to be stressed.
- j) Laminated film is attached to the module surface to prevent it from being scratched. Peel the film off slowly, just before the use, with strict attention to electrostatic charges. Ionized air shall be blown over during the action. Blow off 'dust' on the polarizer by using an ionized nitrogen gun, etc.
- k) The polarizer surface on the panel is treated with Anti-Glare for low reflection. In case of attaching protective board over the LCD. Be careful about the optical interface fringe etc.  
Which degrades display quality.
- l) Connect GND to 4 place of mounting holes to stabilize against EMI and external noise.
- m) There are high voltage portions on the backlight and very dangerous. Careless touch may lead to electrical shock. When exchange lamps or service. Turn off the power without fail.
- n) Be sure not to apply tensile stress to the lamp lead cable.

## 【Result Evaluation Criteria】

Under the display quality test conditions with normal operation state, these shall be no change which may affect practical display function.

## 14. Others

## 1) Lot No Label:

2) Adjusting volume have been set optimally before shipment, so do not change any adjusted value.

If adjusted value is changed, the specification may not be satisfied.

3) Disassembling the module can cause permanent damage and should be strictly avoided.

4) Please be careful since image retention may occur when a fixed pattern is displayed for a long time

5) Do not use LCD module in the atmosphere of corrosive gases, such as sulfide gas or chlorine gases.

Polarizer may deteriorate or cause chemical reaction that can lead to short circuits at the terminal Points. Do not use the material, which compounds contain sulfide or chlorine articles in the vicinity of LCD module. At high temperature, these compounds produce corrosive gases.

6) If any problem occurs in relation to the description of this specification, it shall be resolved through discussion with spirit of cooperation.

### [EXCHANGING THE LAMP UNIT]

The lamp in the LCD module is consumable and when needed, please replace them including lamp holder in accordance with following 1) - 5) procedure.

※ Before exchanging the lamp unit, turn off the power of the inverter without fail.

- 1) The lamp holder①is fixed with the rear side board②by fitting the projection③of the lamp holder to the hole④of the rear side board. (refer to fig 4)
- 2) The projection can be relieved by bending the rear side board to the direction A with hand or minus driver. (refer to fig 5)
- 3) Draw out the lamp holder①to the direction B, bending the board②. (refer to fig 6)
- 4) Insert the spare lamp holder to the direction C. (refer to the fig 6)
- 5) Push the lamp holder①to the position which the projection③is fit in the hole④ of rear side board②.
