### 3.2 BACK-LIGHT UNIT

The back-light system is an edge - lighting type with 2 dual CCFTs ( Cold Cathode Fluorescent Tube ). The characteristics of two dual lamps are shown in the following tables.

Ta=25 ± 2°C

Item	Symbol	Min.	Typ.	Max.	Unit	Note
Lamp Current	IL	2.0	6.5	7.0	mArms	(1)
Lamp Voltage	VL	604	650	696	Vrms	(2)
Lamp Frequency	fL	40	-	60	kHz	(3)
Startup Voltage	Vs	-	-	0°C:1,650	Vrms	(4)
				25°C:1,210		

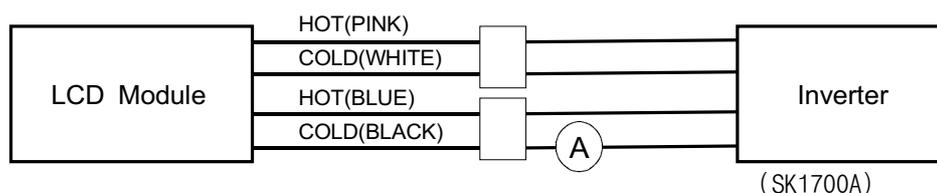

**Note) The inverter must have a symmetric out voltage waveform and be designed on the basis of the modularized lamp.**

The performance of the back-light, for example life time or brightness, is much influenced by the characteristics of the DC-AC inverter for the lamp. So all parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter.

When you design or order the inverter, please make sure that a poor lighting caused by the mismatch of the back-light and the inverter(miss lighting, flicker, etc.) never occur. When you confirm it, the module should be operated on the same condition as it is installed in your instrument.

Note (1) Lamp current is measured with a current meter for high frequency as shown below.

Refer to the block diagram of the back-light unit in the next page for more information. Specified values are for a single lamp.

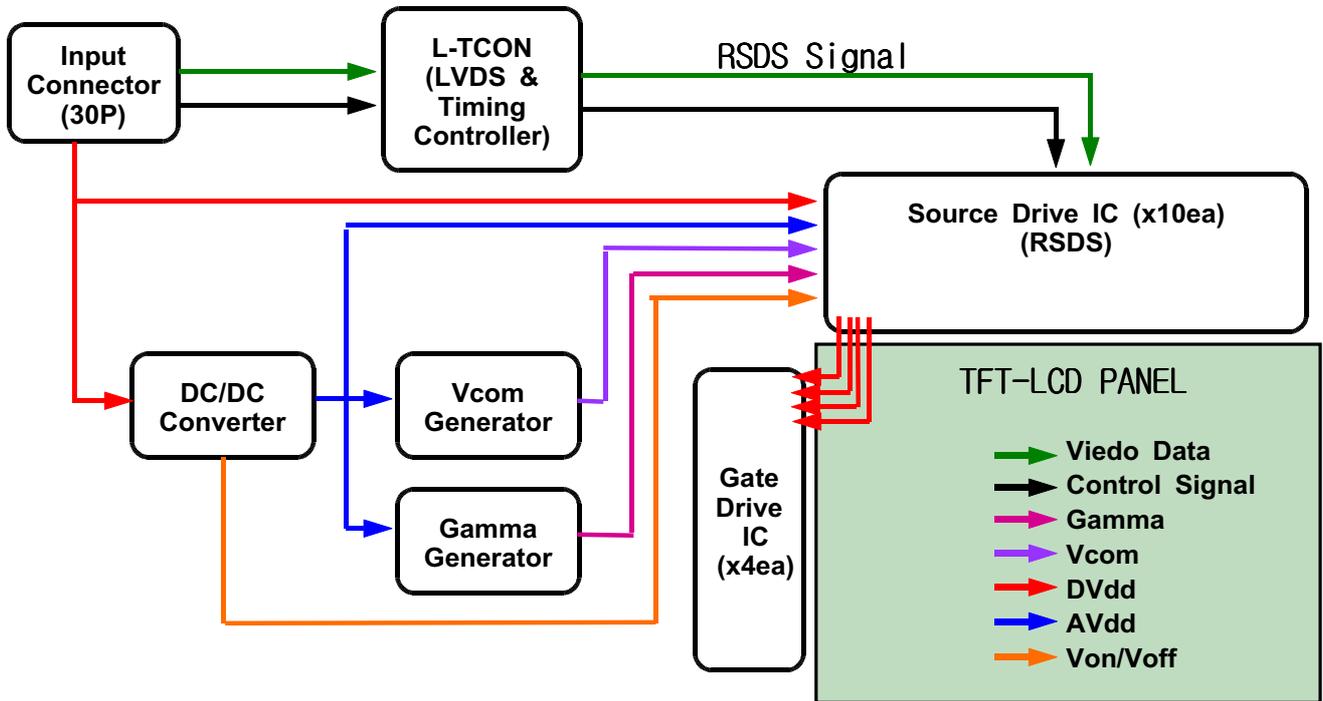

(2) Lamp frequency, which may produce interference with horizontal synchronous frequency which may cause line flow on the display. Therefore lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

(3) Lifetime(Hr) of a lamp is defined as the time in which it continues to operate under the condition of Ta = 25± 2°C and IL = 6.5mA until the brightness becomes 50% or lower than its original value.

(4) If an inverter has shutdown function, it should keep its output for over 1 second even if the lamp connector is open. Otherwise the lamps may not be turned on.

Rn : Red Gray, Gn : Green Gray, Bn : Blue Gray (n = Gray level)

Input Signal : 0 = Low level voltage, 1 = High level voltage

### 6.3 Power ON/OFF Sequence

: To prevent a latch-up or DC operation of the LCD module, the power on/off sequence should follow the diagram shown below.

Power ON/OFF Sequence

#### NOTE.

- (1) The supply voltage from the external system to the module input should be the same as the definition of V<sub>DD</sub>.
- (2) Apply the lamp voltage within the LCD operation range. When the back-light turns on before the LCD operates or the LCD turns off before the back-light does, the display may momentarily show abnormal images.
- (3) In case of V<sub>DD</sub> = off level, please keep the level of input signals low or keep a high impedance.
- (4) T<sub>4</sub> should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal should not be kept in the high impedance state when the power is on.

## 8. General Precautions

### 8.1 Handling

- (a) When the module is assembled, it should be attached to the system firmly using every mounting hole. Be careful not to twist nor bend the modules.
- (b) Refrain from strong mechanical shock and / or any force to the module. Otherwise such force may cause improper operation or damage to the module and CCFT back-light.
- (c) Note that polarizers are very fragile and could be damaged easily. Do neither press nor scratch the surface harder than a HB pencil lead.
- (d) Wipe off water droplets or oil immediately. If you leave the droplets for a long time, stain and discoloration may occur.
- (e) If the polarizer surface is dirty, clean it using some absorbent cotton or soft cloth.
- (f) Desirable cleaners are water, IPA(Isopropyl Alcohol) or Hexane.  
Do not use Ketone type materials(ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might damage to the polarizer permanently due to chemical reaction.
- (g) The liquid crystal material leaked from the panel should be kept away from the eyes or mouth. In case of contact with hands, legs or clothes, it must be washed away thoroughly with soap.
- (h) Protect the module from static which may cause damage to the CMOS Gate Array IC.
- (i) Use finger-stalls with soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (j) Do not disassemble the module.
- (k) Do neither pull nor fold the lamp wire.
- (l) Do not adjust the variable resistor located on the module.
- (m) Protection film of polarizer on the module should be slowly peeled off just before use so that the electrostatic charge is minimized.
- (n) Pins of I/F connector should not be touched directly with bare hands.

## 8.2 Storage

- (a) Do not leave the module in high temperature, high humidity for a long time. It is highly recommended to store the module with temperature from 0 to 35°C and relative humidity of less than 70%.
- (b) Do not store the TFT-LCD module under the direct sunlight.
- (c) The module should be stored in a dark place. It is prohibited to apply sunlight or fluorescent light in storing.

## 8.3 Operation

- (a) Do neither connect nor disconnect the module in the "Power On" condition.
- (b) Power supply should always be turned on/off by the item 6.3 "Power on/off sequence"
- (c) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference should be given by system manufacturers. Grounding and shielding methods may be important to minimize the interference.
- (d) The cable between the back-light connector and its inverter power supply should have a minimized length and be connected directly. A longer cable between the back-light and the inverter may cause lower luminance of lamp(CCFT) and require higher startup voltage(Vs).

## 8.4 Others

- (a) An ultra-violet ray filter is necessary for outdoor operation.
- (b) Avoid condensation of water. It may result in improper operation or disconnection of electrode.
- (c) Do not exceed the absolute maximum rating value. ( the supply voltage variation, input voltage variation, variation in part contents and environmental temperature, and so on)  
Otherwise the module may be damaged.
- (d) Displaying the same pattern continuously for a long time may induce the situation that the image "Sticks" to the screen.
- (e) Because the module has its circuitry PCB on the rear side, it should be handled carefully in order not to stress the PCB.
