1. OUTLINE

1.1 STRUCTURE AND PRINCIPLE

SVA170SX01TB module is composed of the amorphous silicon thin film transistor liquid crystal display (a-Si TFT LCD) panel structure with driver LSIs for driving the TFT (Thin Film Transistor) array and a backlight.

The a-Si TFT LCD panel structure is injected liquid crystal material into a narrow gap between the TFT array glass substrate and a color-filter glass substrate.

Color (Red, Green, Blue) data signals from a host system (e.g. PC, signal generator, etc.) are modulated into best form for active matrix system by a signal processing board, and sent to the driver LSIs which drive the individual TFT arrays.

The TFT array as an electro-optical switch regulates the amount of transmitted light from the backlight assembly, when it is controlled by data signals. Color images are created by regulating the amount of transmitted light through the TFT array of red, green and blue dots.

Note2: Pattern for maximum current (2H1V dot inverse, 0/255 scale)

Note3: Common mode voltage for LVDS driver

Note4: TxSEL is inside pull-up signal (pull-up resistor :about 50KΩ)

4.3.2 Driving for backlight lamp

(Ta=25°C) Note1

Parameter	Symbol	min.	typ.	max.	Unit	Remarks
Lamp voltage	VBLH	-	580	-	Vrms	Note2、 Note3
Lamp current	IBL	3.5	7.5	9.0	mA	Note3
Lamp starting voltage (discharge stabilization voltage)	Vs	970	-	-	Vrms	Ta = 25°C Note2、 Note3
		1120	-	-	Vrms	Ta =0°C Note2、 Note3
Lamp oscillation frequency	FO	40	48	55	kHz	Note4

Note1: The backlight of this product is made up of 4-piece lamp. The specification above is only for one lamp.

Note2: The voltage timing cycle of each lamp should be set as the same phase. [Vs] and [VBLH] is the voltage between the high port and low port, the value is the characteristic of lamp. The starting voltage of inverter should be higher than the value. The possibility of not lighting exists by the lower voltage, so the suitable voltage should be considered by the test .

Note3: The asymmetric ratio of working waveform for lamps (Lamp voltage peak ratio, Lamp current peak ratio and waveform area ratio) should be less than 5% (See the following figure). If the waveform is asymmetric, DC (Direct current) element applies into the lamp. In this case, a lamp lifetime may be shortened, because a distribution of a lamp enclosure substance inclines toward one side between low voltage terminal (Cold terminal) and high voltage terminal (Hot terminal).

$$\begin{aligned} |Pa - Pb| / Pb \times 100 &\leq 5\% \\ |Sa - Sb| / Sb \times 100 &\leq 5\% \end{aligned}$$

Pa: Supply voltage/current peak for positive, Pb: Supply voltage/current peak for negative

Sa: Waveform space for positive part, Sb: Waveform space for negative part

Note4: In case "FO" is not the recommended value, beat noise may display on the screen, because of interference between "FO" and "1/th". Recommended value of "FO" is as following.

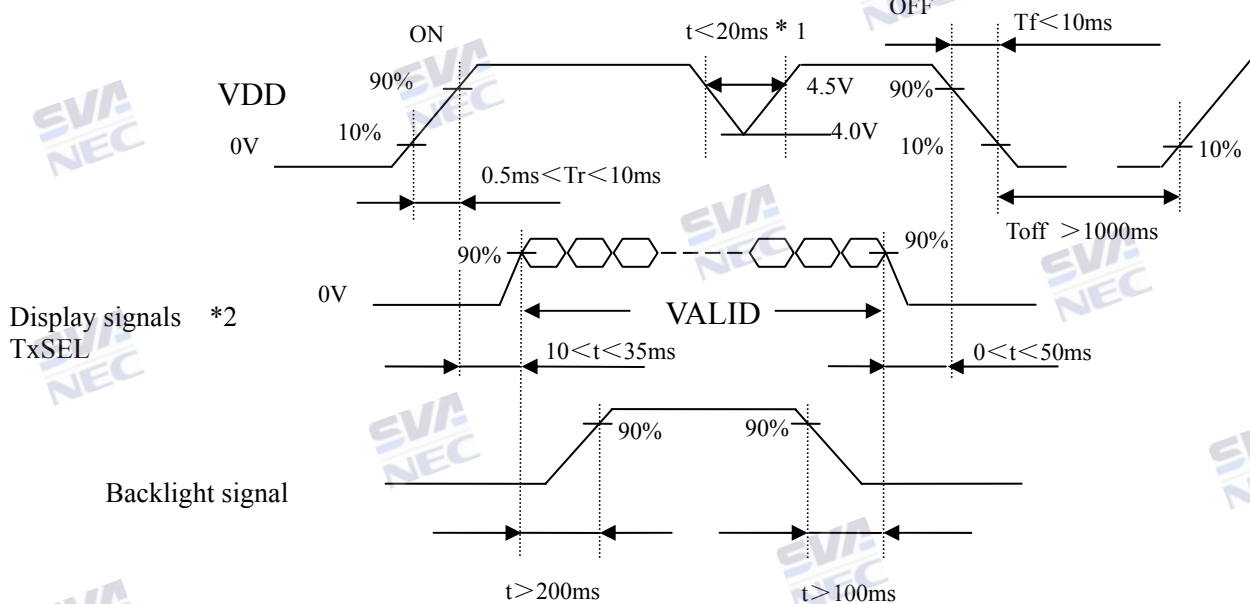

$$FO = 1/4 \times 1/th \times (2n-1)$$

Th: Horizontal signal period(See "4. 8.1 Timing characteristics".)

n: Natural number (1, 2, 3

4.4 POWER SUPPLY VOLTAGE SEQUENCE AND RIPPLE

4.4.1 Power supply voltage sequence

*1. When VDD is on, but the value is lower than 4.5V, a protection circuit may work, then the module may not display.

*2 The signal line is not connected with the module, at the end of cable the terminal resistor of 100Ω should be added.

Note1: Display signals (D0+/-, D1+/-, D2+/-, D3+/- and CK+/-) and function signal (MSL) must be "0" voltage, exclude the VALID period (See above sequence diagram). If these signals are higher than 0.3 V, the internal circuit is damaged.

If some of display and function signals (TxSEL) of this product are cut while this product is working, even if the signal input to it once again, it might not work normally. If customer stops the display and function signals (TxSEL), they should cut VDD.

Note2: When VDD is on, it should be set above 4.0V.

Note3: The backlight power supply voltage should be inputted within the valid period of display and function signals, in order to avoid unstable data display.

4.4.2 Power supply voltage ripple

When the power supply is designed, the next form can give the reference. If the voltage ripple is over the value in next form, the noise should be seen in display area.

Ripple (Measured at input terminal of power supply)

	VDD(5V to drive the panel)
Ripple voltage	≤100mVP-P (Including spike noise)

4.4.3 Fuse

Parameter	Fuse		Rating	Fusing current	Remarks
	Type	Supplier			
VDD	TF16SN3.15	KOA Corporation	2.5 A	6.3 A	Note1
			32 V		

Note1: The power supply capacity should be above twice than the fusing current. . If the power supply capacity is less than the fusing current, the fuse may blow in a short time, and then nasty smell, smoking and so on may occur.

Note: It is suggested that the cycle of horizontal signals fluctuate in the range of $\pm 10\text{CLK}$. In case go beyond that range, probably the false action would happen to the loop .

For example, in case the cycle of horizontal signals is 844CLK, the allowable fluctuation range is 834~854CLK.

Note2: Measurement conditions are as follows.

Ta=25°C, VDD=5.0V, IBL=7.5mA/m/lamp, Display mode: SXGA, Horizontal cycle=64.0KHz, Vertical cycle=60.0Hz

Optical characteristics are measured at luminance saturation after 20minutes from working the product in the dark room. Also measurement method for luminance is as follows.

Luminance Meter (TOPCON BM-5A)
Spectroradiometer(TOPCON SR-3)

Note 3: See “4.9.2 Definition of contrast ratio”.

Note 4: See “4.9.3 Definition of luminance uniformity”.

Note 5: CIE 1931 Chromaticity Diagram Standard.

Note 6: Product surface temperature: TopF = 33.0 °C

Note 7: See “4.9.4 Definition of response times”.

Note 8: See “4.9.5 Definition of viewing angles”.

4.9.2 Definition of contrast ratio

The contrast ratio is calculated by using the following formula.

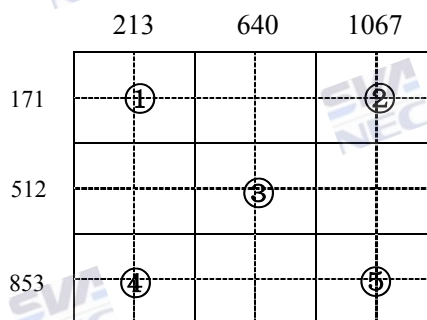

$$\text{Contrast ratio (CR)} = \frac{\text{Luminance of white screen}}{\text{Luminance of black screen}}$$

4.9.3 Definition of luminance uniformity

The luminance uniformity is calculated by using the following formula.

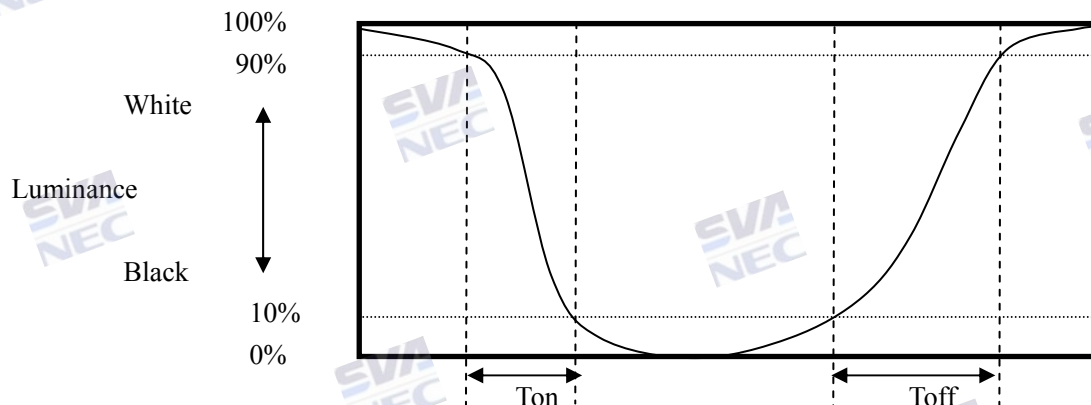

$$\text{Luminance uniformity (LU)} = \frac{\text{Maximum luminance from ① to ⑤}}{\text{Minimum luminance from ① to ⑤}}$$

The luminance is measured at near the 5 points shown below.

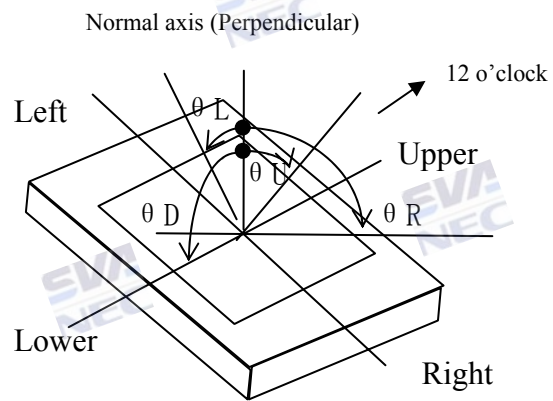

4.9.4 Definition of response times

Response time is measured, the luminance changes from “white” to “black”, or “black” to “white” on the same screen point, by photo-detector. Ton is the time it takes the luminance change from 90% down to 10%. Also Toff is the time it takes the luminance change from 10% up to 90%. (See the following diagram.)

6. ESTIMATED LUMINANCE LIFETIME

The luminance lifetime is the time from initial luminance to half-luminance.

This lifetime is the estimated value, and is not guarantee value.

Condition		Luminance lifetime(MTTF) Note1	Unit
Module	(Ambient temperature of the product) Continuous operation and IBL=7.5mArms/lamp	TBD	h
	50℃(Surface temperature at screen center) Continuous operation and IBL=7.5mArms/lamp	TBD	h
Cold cathode Fluorescent lamp, Note2	25℃(Ambient temperature of the product) Continuous operation and IBL=7.5mArms/lamp	42000(min) 50000(typ)	h

Note1: MTTF is mean time to half-luminance. In case the product works under low temperature environment, the lifetime becomes short.

Note2: This is reference data. This is the CCFL lifetime, not the lifetime of LCD module.

7. PACKING, TRANSPORTATION AND DELIVERY

SVA-NEC will pack products to deliver to customer in accordance with SVA-NEC packing specifications, and will deliver products to customer in such a state that products will not suffer from a damage during transportation .The delivery conditions are as follows.

7.1 PACKING

(1) Packing box

5 products are packed up with the maximum in a packing box(See “7.5 OUTLINE FIGURE FOR PACKING “).

Products are put into a plastic bag for prevention of moisture.

The type name and quality are shown on outside of the packing box, either labeling or printing.

(2)Pallet Packing (See”7.5 OUTLINE FIGURE FOR PACKING “)

- ① Packing boxes are tired on a cardboard pallet.(12 boxes×3 tiers maximum)
- ②Cardboard sleeve and top cap are attached to the packing boxes, then they are fixed by a band.

7.2 INSPECTION RECORD SHEET

Inspection record sheets are included in the packing box with delivery products to customer. It is summarized to a number of products for pass/fail assessment.

7.3 TRANSPORTATION

The product is transported by vehicle, aircraft or shipment in the state of pallet packing.

7.4 SIZE AND WEIGHT FOR PACKING BOX

8. PRECAUTIONS

8.1 MEANING OF CAUTION SIGNS

The following caution signs have very important meaning. **Be sure to read “10.2 CAUTIONS” and “10.3 ATTENTIONS”, after understanding these contents!**

This sign has the meaning that customer will be injured by himself or the product will sustain a damage, if customer has wrong operations.

This sign has the meaning that customer will get an electrical shock, if customer has wrong operations.

This sign has the meaning that customer will be injured by himself, if customer has wrong operations.

8.2 CAUTIONS

touch lamp cables while turn on. Customers will be in danger of an electric shock

- * Do not touch the working backlight and IC. Customers will be in danger of burn injury.
- * Do not shock and press the LCD panel and the backlight! There is a danger of breaking, because they are made of glass. (shock : To be not greater 294m/s^2 and to be not greater 11ms, Pressure: To be not greater 19.6N)

8.3 ATTENTIONS

8.3.1 Handling of the product

- ① Take hold of both ends without touch the circuit board when customer pulls out products (LCD modules) from inner packing box. If customer touches it, products may be broken down or out of adjustment, because of stress to mounting parts.
- ② Do not hook cables nor pull connection cables such as flexible cable and so on, for fear of damage.
- ③ If customer puts down the product temporarily, the product puts on flat subsoil as a display side turns down.
- ④ Take the measures of electrostatic discharge such as earth band, ionic shower and so on, when customer deal with the product, because products may be damaged by electrostatic.
- ⑤ The torque for mounting screws must never exceed 0.34N·m. Higher torque values might result in distortion of the bezel.
- ⑥ The product must be installed using mounting holes without undue stress such as bends or twist (See outline drawings). And do not add undue stress to any portion (such as bezel flat area) except mounting hole portion.

Bends or twist described above and undue stress to any portion except mounting hole portion may cause display un-uniformity.

- ⑦ Do not press or rub on the sensitive display surface .If customer clean on the panel surface, SVA-NEC recommends using the cloth with ethanolic liquid such as screen cleaner for LCD.
- ⑧ Do not push-pull the interface connectors while the product is working, because wrong power sequence may break down the product.
- ⑨ Do not bend or unbend the lamp cable at the near part of the lamp holding rubber, to avoid the damage for high voltage side of the lamp. This damage may cause a lamp breaking and abnormal operation of high voltage circuit.

8.3.2 Environment

- ① Do not operate or store in high temperature, high humidity, dewdrop atmosphere or corrosive gases. Keep the product in antistatic pouch in room temperature, because of avoidance for dusts and sunlight, if customer stores the product.
- ② In order to prevent dew condensation occurring by temperature difference, the product packing box must be opened after leave under the environment of an unpacking room temperature enough. Because a situation of dew condensation occurring is changed by the environment temperature and humidity, evaluate the leaving time sufficiently. (Recommendation leaving time: 6 hour or more with packing state)
- ③ Do not operate in a high magnetic field .Circuit boards may be broken down by it.
- ④ This product is not designed as radiation hardened.
- ⑤ Use an original protection sheet on the product surface (polarizer). Adhesive type protection sheet should be avoided, because it may change color or properties of the polarizer.

8.3.3 Characteristics

The following items are neither defects nor failures.

- ① Response time, luminance and color may be changed by ambient temperature.
- ② The LCD may be seemed luminance non-uniformity, flicker, vertical seam or small spot by display patterns.
- ③ Optical characteristics (e.g. luminance, display uniformity, etc.) gradually is going to change depending on operating time ,and especially low temperature, because the LCD has cold cathode fluorescent lamps.
- ④ Do not display the fixed pattern for a long time because it may cause image sticking .Use a screen saver, if the fixed pattern is displayed on the screen.
- ⑤ The display color may be changed by viewing angle because of the use of condenser sheet in the backlight.
- ⑥ Optical characteristics may be changed by input signal timings.
- ⑦ The interference noise of input signal frequency for this product and luminance control frequency of customer's backlight inverter may appear on a display. Set up luminance control frequency of backlight inverter so that the interference noise does not appear.

8.3.4 Other

- ① All GND and VCC terminals should be used without a non-connected line.
- ② Do not disassemble a product or adjust volume without permission of SVA-NEC.
- ③ See "REPLACEMENT MANUAL FOR LAMPHOLDER SET", if customer would like to replace backlight lamps.
- ④ Pay attention not to insert waste materials inside of products, if customer uses screw nails.
- ⑤ Pack the product with original shipping package, because of avoidance of some damages during transportation, when customer returns it to SVA-NEC for repair and so on .
- ⑥ Not only the module but also the equipment should be packed and transported as the module. becomes vertical .Otherwise, there is the fear that a display dignity decreases by an impact or vibrations.
